```
The present sequence represents a human platelet-derived growth factor C (PDGF-C) (formally designated VEGF-F) fragment. PDGF-C polypeptides have the ability to stimulate and enhance proliferation or differentiation, and/or growth or motility of cells expressing a PDGF-C receptor.

C PDGF-C polypeptides can be used in pharmaceuticals for promoting cell proliferation, preferably in combination with one other growth factor and heparin. Pharmaceuticals comprising PDGF-C polypeptides can also be used for stimulating connective tissue or wound healing. The C PDGF-C polypeptide can be enzymatically processed to generate the active truncated form of PDGF-C and used to regulate the receptor inding specificity of PDGF-C. PDGF-C and also be used to promote fibroblast mitogenesis in a mammal and to induce PDGF alpha receptor activation.

C Antagonists can be used to inhibit tumour growth of a tumour expressing PDGF-C in a mammal. Specific types of human tumours, e.g. choriocarcinoma, Wilms tumour, megakaryoblastic leukeamia, lung carcinoma and erythroleukemia, can be dentified by testing for expression of PDGF-C. PDGF-C antagonists can also be used to inhibit tissue remodelling during invasion of tumour cells into a normal population of cells. Antagonists can also be used to inhibit conditions,
                                                                                                                                                                                                                     Novel DNA encoding PDGF-C useful to stimulate or enhance proliferation, differentiation, growth and motility of cells expressing the PDGF-C \,

```
Polynucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB58548. Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; cardioactive; cardioactive; cardioactive; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antilnfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences. The lung cancer associated chromosome identification, as chromosome markers, and fung cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The proteins may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, reproductive, disorders. The proteins may also be used in the treatment of wounds and confident and proliferative disorders. The proteins may also be used in the treatment of wounds and cancer and dispesses. Polynucleotide sequences AAP1845 - AAB18433 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lung cancer associated gene sequences, referred to as lung cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as lung cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptide AAB58549 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-MAR-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes the isolation of a novel human vascular endothelial cell growth factor-E (VEGF-E) polypeptide which has tranquillizer, vulnery and cardiant activity. VEGF-E can be administered therapeutically, especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially humans it is useful in wound repair and tissue generation and cardiac hypertrophy cran be combined with a carrier in pharmaceutical compositions, which regeneration, and may especially be used to treat cardiac hypertrophy can be combined with a carrier in pharmaceutical compositions, which can be administered to treat disorders as above. VEGF-E can be used to screen for antagonists and disorders, and the antagonists administered to screen for antagonists and agonists, as above. VEGF-E can be used to despend the antagonists, as above. The antibodies, useful therapeutically as antagonists, as above. The antibodies are also useful to detect VEGF-E polypeptide, especially to diagnose cardiovascular, endothelial or angiogenic disorders in mammals (e.g. vascular disease, or neovascularization associated with tumor formation), by contacting the antibody with a tissue sample and detecting formation of an in mammals, by detecting abnormally high or low VEGF-E gene expression in the VEGF-E can be used to diagnose a disease or susceptibility to a disease related to a mutated form of VEGF-E (e.g. a cardiovascular, endothelial or anglogenic disorder such as a tumor), by cannot many also be used to adaptopenic disorder such as a tumor), by cannot be maded to the many also be used to diagnose a disease or a cardiovascular, the dothelial or anglogenic disorder such as a tumor), by cannot be maded to the many also be used to diagnose a disease or and cardiovascular, the dothelial or anglogenic disorder such as a tumor), by cannot be used to an autated form of vector and the cardiovascular, the detecting a mutated form of a disease related to a mutated form of a disease related to a mutated fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sample. They may also be used to produce probes useful to detect related sequences or for gene mapping. This sequence represents the human VEGF-E protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 CCLHNCNECQCVPSKVTKKYHEVLQLRPKTGVRGLHKSLTDVALEHHEECDCVCRGSTGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                       secreted and transmembrane polypeptides and their polynucleotides, in for treating blood coagulation disorders, cancers and cellular

The present sequence represents a vascular endothelial growth factor related (VEGF-R) protein. VEGF-R can be used in assays to identify compounds that bind to it or that antagonize its activity. VEGF-R antagonists (e.g. anti-VEGF-R antibodies) are useful for inhibiting tissue growth. This is useful for inhibiting transulate tissue aromer. VEGF-R itself can be used to stimulate tissue yerowth, anglogenesis and to treat coronary artery blockage. The VEGF-R coding sequence can be used for the recombinant production of
                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to the human growth factor homologue zvegf4

(AAB48653), and nucleic acids encoding it (AAC8155). Zvegf4 is a member
of the PDGF (platelet-derived growth factor)/VEGF (vascular endothelial)
growth factor) family. Zvegf4 has a growth factor domain (AAB48654)
characterised by a PDGF cystine knot structure, and a CUB domain
characterised by a PDGF cystine knot structure. Zvegf4 has PDGF-like
activity having mitogenic activity on fibroblasts, vascular smooth
muscle cells and pericytes, and has also been shown to stimulate bone
growth. The invention also relates to fusion proteins comprising human
cc growth. The invention also relates to fusion proteins comprising human
cc growth. The invention also relates to fusion proteins comprising human
cc growth. The invention also relates to fusion proteins comprising human
cc growth. The invention also relates to fusion proteins comprising human
cc growth. The invention also relates to fusion proteins and phuman zvegf4
nucleic acids; the recombinant expression of human zvegf4, an antibody
which binds to human zvegf4 or a fragment thereof; a method of activating
a cell-surface PDGF receptor using a zvegf4-derived polypeptide; a
cell-surface PDGF receptor using a zvegf4-derived polypeptide; a
cmethod of modulating the proliferation, differentiation, migration or
cvegf4-derived polypeptides; and a method of detecting a genetic
c abnormality in the zvegf4 gene of a patient. Zvegf4 proteins and derived
cc fragments may be used to stimulate tissue development or repair, or
ccellular differentiation or proliferation. They are particularly used for
ccellular differentiation or proper and method or development or repair, or
ccellular differentiation or proliferation. They are particularly to a

the progress of atherosclerosis or treating atherosclerosis comprising the administration of an LPB antagonist. The method is useful for enhancing tissue growth, promoting wound healing and stimulating smooth muscle growth. Antagonists of LPB are useful for treating

muscle growth. Antagonists of LP8 are useful for treating atherosclerosis. The present sequence represents human LP8, which is

also called VEGFh.

345 AA;

Sednence

or

promoting wound healing or stimulating smooth muscle growth by administering a platelet-derived growth factor (PDGF) related protein, designated LP8 or its analogue. Also described is a method of slowing

The present invention describes a method for enhancing tissue growth,

Claim 4; Page 63-64; 64pp; English.

Enhancing tissue growth and promoting wound healing by administering platelet-derived growth factor related protein, LP8 or its analog and treating atherosclerosis by administering LP8 antagonist  $\,$ 

```
AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in
                                                                                                                                                 Human; secreted protein; transmembrane protein; PRO; EST; cytostatic; expressed sequence tag; detection; cancer.

```
This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (1a) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood and tissue repenir in a subject. The products of the invention and organ and tissue repenir mag abubject treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the RACE generated human VEGF-X protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                     VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic;
                                                                                                                                                                                                                                                                                                                                                   antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment, anglogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -

(VEGE-X) protein (Ia) and its encoding polynuclectide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidabetic activity and acts as an angiogenesis and vasculaticand regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic ethinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ of the subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graff growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-X protein homologue described in the method of the invention.

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirhematic, antirhentic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating concer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ at tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-X protein isolated from clones 4 and 7 described in the method of the invention.

An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-X protein isolated from clones 4 and 7 described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate anglogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood
for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents a human VEGF-X protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -

This DNA encodes human ZVEGF3 (a novel vascular endothelial growth factor homologue) fused N-terminally to maltose binding protein (MBP). Polypeptides comprising an epitope-bearing portion human or murine and a CUB domain (generic sequence motifs are shown in AAY96859 and AAY96860). The growth factor comprise a growth factor domain and a CUB domain (generic sequence motifs are shown in AAY96859 and AAY96860). The growth factor domain is characterized by an arrangement of cysteine residues and beta-strands that is characteristic of the cysteine knot" structure of the platelet-derived growth factor (PDGF) family. The CUB domain shows homology to CUB domains in neuropilins, human bone morphogenetic protein-1, porcine seminal plasma protein, bovine acidic seminal fluid protein and Xenopus laevis tolloid-like bovine acidic seminal shows homology predict that ZVEGF3 is protein. Structural analysis and homology predict that ZVEGF3 is proteins. The human zvegf3 gene has been mapped to chromosome 4q28.3 zvegF3 is useful for stimulating the growth of fibroblasts or smooth cuscles cells, for activating cell surface PDGF-alpha receptor and for inhibiting PDGF-alpha receptor mediated cellular processes. ZVEGF3 is useful for regulating (post-development) organ growth, regeneration and maintenance, as well as tissue maintenance and repair processes. ZVEGF3 antagonists are useful for treating cancer, rheumatoid arthritis, and characterial intender intimal hyperplasia, atherosclerasis, conditions and contraction and contracti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nealing, chronic liver disease and haemangioma formation. This invention describes a novel vascular endothelial growth factor-X (VEGFX) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, preparing medicaments for treating wounds such as dermal ulcers, skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting anglogenic activity or tissue regeneration and organ repair by promoting anglogenic activity or
                                                                                                                                                                                                                                                                                                                                                                            preventing diseases associated with inappropriate angiogenesis activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       scularization. This sequence encodes a human VEGF-\boldsymbol{x} protein which can expressed in E. coli systems and which is described in the method of
                                                                                                                                                                                                                                                                                                                                                        New vascular endothelial growth factor protein, useful for treating
                                                                                                                                                                                                                                         Ą
                                                                                                                                                                                                                                         Gosiewska
                                                                                                                                                                                                                                                                                                                                                                                                 such as cancer, rheumatoid arthritis, psoriasis and wounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        789
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         34
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               67

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             935
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     985
 This invention describes a novel vascular endothelial growth factor-X (VEGP-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an antiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful
                                                                                                                                                                                                                                                                                                                                                        VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (VEGE-X) protein (Ta) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ at issue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence encodes a human VEGE-X protein which can be expressed in Baculovirus/insect cell systems and which is described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel vascular endothelial growth factor-X
                                                                                                                                                                                                                                                                                                                                                                          Gosiewska A;

Human, VEGF/PDGF-like factor; vascular endothelial growth factor; VEGF; platelet derived growth factor; PDGF; neovascularisation; disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New VEGF/PDGF-like factor useful for the development of treating agents for diseases accompanied by accentuation of abnormal neovascularization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a novel vascular endothelial growth factor (VBGF)/platelet derived growth factor (PBGF)-like factor. The invention relates to the present 345 amino acid sequence or as sequence in which at least one amino acid is deleted, replaced or added compared to the present sequence. The nucleotide sequence encoding this protein may be integrated into a vector and used to transform a host cell. The VBGF/PBGF-like factor may be used to development of agents for treating diseases associated with
                                                                                                                                                                       1064

This invention describes a novel vascular enocurellar grown factor. A (VEGE-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and inflabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, wenous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair play promoting angiogenic activity or vascularization. This sequence encodes the human vEGF-X protein isolated from clones 4 and 7 described in the method of the invention.
New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                              This invention describes a novel vascular endothelial growth factor-X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TAAGGGAAGAACTAAAGAGAACCGATACCATTTTCTGGCCAGGTTGTCTC 1081

The invention relates to the human growth factor homologue zvegf4

(AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4 is a member

of the PDGF (platelet-derived growth factor)/VEGF (vascular endothelial

growth factor) family. Zvegf4 has a growth factor domain (AAB48654)

c dracterised by a PDGF cystine knot structure, and a CUB domain

c characterised by a PDGF cystine knot structure. Zvegf4 has PDGF-like.

CC AAA88655) which has a beta barrel structure. Zvegf4 has PDGF-like.

activity, having mitogenic activity on fibroblasts, vascular smooth

cc activity, having mitogenic activity on fibroblasts, vascular smooth

                                                                                                                                                                                                                                                                                                                                                                                                                                                      designated ZVECF3 are claimed. The growth factors comprise a growth human or murine ZVECF3 are claimed. The growth factors comprise a growth factor domain and a CUB domain in Generic sequence motifs are shown in AXY96859 and AXY96860). The growth factor domain is characterized by an arrangement of cysteine residues and beta-strands that is characteristic of the "cysteine knot" structure of the platelet derived growth factor (PDGF) family. The CUB domain shows homology to CUB domains in neurophlins, human bone morphogenetic protein. Up porcine seminal plasma protein. Structural analysis and homology predict that ZVEGF3 polypeptides complex with a second polypeptide to form multimeric proteins. The human zvegf3 gene has been mapped to chromosome 4q28.3. ZVEGF3 is useful for stimulating the growth of fibroblasts or smooth muscles dells, for activating cell surface PDGF-alpha receptor and for inhibiting PDGF-alpha receptor mediated cellular processes. ZVEGF3 is useful for regulating (post-development) organ growth, regeneration and maintenance, as well as tissue maintenance and repair processes. ZVEGF3 antagonists are useful for treating cancer, rheumatoid arthritis, disbemia, vascular intimal hyperplasia, attended to a structure growth and for disease, myocardial ischemia, vascular intimal hyperplasia, attended to a second to mediate neurite growth and for development of the nervous system, and for treating neurodegenerative
                                                                                                                                                                                                                                                                                              Novel zvegf3 polypeptides and nucleotides encoding them useful for stimulating growth of smooth muscle cells and fibroblasts comprising an epitope bearing portion of a specific amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                             cDNA encodes a human vascular endothelial growth factor homologue,

```
proliferation or extracellular matrix production, treating fibrosis and reducing stellate cell activation in a mammal. The method comprises administering a composition in a mammal. The method comprises administering a composition containing a Yvegf3 antagonist in combination with a delivery vehicle. The Zvegf3 is a protein that is structurally related to platelet-derived growth factor (PDGF) and the vascular endothelial growth factors (VEGF). The Zvegf3 protein is also designated as "VEGF-R" and "PDGF-C". The Zvegf3 antagonist is useful to block the mitogenic effects of zvegf3 and thereby to inhibit or prevent and treat keloids, scleroderma, fibrotic disorders of liver such as chronic active hepatitis, fulminant viral hepatitis, post necrotic cirrhosis and alpha-1-antitrypsin defliciency, fibrotic disorders of the kidney such as diabetic glomerulosclerosis, focal glomerulosclerosis, diabetic nephropathy, amyloidosis and renal arteriosclerosis, fibrotic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of the lung such as silicosis, asbestosis, idiopathic pulmonary fibrosis, bronchiolitis obliterans-organising pneumonia and pulmonary hypertension, fibrotic disorders of pancreas, fibroproliferative disorders of the vasculature such as transplant vasculopathy and fibroproliferative disorders of the bone such as osteopetrosis and hyperostosis. The present sequence is human 2vegf3 DNA.

PDGF-C antagonists can be used to inhibit tumour growth of a tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel DNA encoding PDGF-C useful to stimulate or enhance proliferation, differentiation, growth and motility of cells expressing the PDGF-C \,

PDGF-C polypeptides have the ability to stimulate and enhance proliferation or differentiation, and/or growth or motility of cells expressing a PDGF-C receptor. PDGF-C polypeptides can be used in pharmaceuticals for promoting cell proliferation, preferably in combination with one other growth factor and heparin. Pharmaceuticals complising PDGF-C polypeptides can also be used for stimulating connective tissue or wound healing. The

Specific types of human tumours, e.g. choriocarcinoma, Wilms tumour, megakaryoblastic leukaemia, lung carci and erythroleukemia, can be identified by testing for expression of PDGF-C PDGF-C antagonists can also be used to inhibit tissue remodelling during invasion of tumour cells into a normal population cells. Antagonists can also be used to treat fibrotic conditions, especially found in the lung, kidney or liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ĸ

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiartitic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating corperventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, the sequence encodes the RACE generated human VEGF-X vertices.
                                                                                                                                                                                                                          New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirhemmatic, antiparthitic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence encodes a human VEGF-X protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gosiewska A;

This invention describes a novel vascular endothelial growth factor-X
(VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has
vulnerary, oytostatic, antirheumatic, antipsoriatic and
antidiabetic activity and acts as an anglogenesis and vascularization
cegulator. An antisense molecule of the invention is useful for treating
regulator. An inhibiting anglogenic activity or inappropriate
or preventing cancer, rheumatoid arthritis, psoriasis and diabetic
retinopathy by inhibiting anglogenic activity or inappropriate
vascularization including formation and proliferation of new blood
vessels, growth and development of tissues, tissue regeneration and organ
and tissue repair in a subject. The products of the invention are useful
for preparing medicaments for treating wounds such as dermal ulcers,
for preparing medicaments for treating wounds such as dermal ulcers,
for preparation and organ repair, proliferation of new blood vessels,
tissue regeneration and organ repair by promoting anglogenic activity or
vascularization. This sequence encodes the human VEGF-X protein homologue
described in the method of the invention.
                                                                                                                                                                                                                                                                                                                    preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds \mbox{-}
                                                                                                                                                                                                                                                                                                  New vascular endothelial growth factor protein, useful for treating
                                                                                                                                                                        Gosiewska A;

This sequence represents cDNA encoding human growth factor related molecule GFRP-4. cDNA encoding GFRP-4 was initially identified in a diseased breast tissue cDNA library, and the present sequence represents a consensus derived from several overlapping and/or extended cDNA clones. GFRP-4 has chemical and structural homology with human bone morphogenetic protein 1 (BMP-1) (27% identity at the BMP-1 C-terminus). GFRP-4 was found by Northern analysis to be expressed in reproductive and cardiovascular tissue, and in cDNA libaries associated with cancer, inflammation and the immune response. GFRP proteins (AAB03000-B03003), nucleotides encoding them (AAA52455-A55458), GFRP gronists and antagonists may be used to treat a wide variety of diseases associated with increased or decreased expression or activity of GFRP proteins. Conditions which may be treated include developmental disorders, cell Human growth factor related molecule protein useful for the diagnosis and treatment of disorders associated with its activity including developmental, cell proliferative, immune, reproductive and cardiovascular disorders and infections -Claim 9; Page 76; 80pp; English.

This invention describes the isolation of a novel human vascular endothelial cell growth factor-E (VEGF-E) polypeptide which has transported and properties of transported and transported and the administered therapeutically, especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially humans. It is useful in wound repair and tissue generation and regeneration, and may especially be used to treat cardiac hypertrophy it can be combined with a carrier in pharmaceutical compositions, which can be administered to treat disorders as above. VEGF-E can be used to screen for antagonists and agonists, and the antagonists administered to treat angiogenic disorders in mammals (especially humans) e.g. cancer or reat angiogeneration. It can be used to generate antibodies, useful therapeutically as antagonists, as above. The antibodies are also useful to detect VEGF-E polypeptide, especially to diagnose cardiovascular, endothelial or angiogenic disorders in mammals (e.g. vascular disease, or neovascularization associated with tumor formation of an antibody-VEGF-E polypeptide complex. Polynucleotides encoding VEGF-E can be used to diagnose cardiovascular and endothelial disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in mammals, by detecting abnormally high or low VEGF-E gene expression in tissue samples. They can also be used to diagnose a disease or susceptibility to a disease related to a mutated form of VEGF-E (e.g. a cardiovascular, endothelial or angiogenic disorder such as a tumor), by detecting a mutation in the VEGF-E-encoding sequence isolated from a sample. They may also be used to produce probes useful to detect related sequences or for gene mapping. This sequence encodes the human VEGF-E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                984 AGAGGAGGTAAGATTATACAGCTGCACACCTCGTAACTTCTCAGTGTCCA 1033
